

Utkarsh Gupta

Technical Support & Troubleshooting

+91 9754329107 | utk9rsh@gmail.com | LinkedIn | Github | Portfolio | Indore, India

SUMMARY

Engineering undergraduate with hands-on experience diagnosing and resolving real technical issues across data pipelines, integration errors, and system anomalies – and clearly documenting root cause and resolution for others to follow. Comfortable working with messy, real-world data and ambiguous problems, breaking them down systematically rather than guessing. Strong written communication, patient troubleshooting instinct, and a habit of explaining technical findings in plain language for non-technical audiences. Seeking technical support / customer success roles where clear communication and calm problem-solving matter as much as technical accuracy.

RELEVANT SKILLS

Troubleshooting & Support: Root cause analysis, technical debugging, issue documentation, escalation-ready write-ups, QA / data validation

Communication: Clear technical writing, translating technical findings for non-technical audiences, structured documentation (Notion, Markdown), presentation delivery (AROHAN 2025 conference)

Technical: Python (Pandas, NumPy), SQL (basic), Git, spreadsheet/data tools (Excel, Power BI), API/webhook debugging

Domain Exposure: Data pipelines, financial/scenario modeling, energy systems, embedded hardware

PROBLEM RESOLUTION EXPERIENCE

Technical Debugging & Documentation | *DISCOM Revenue Leakage & Battery Arbitrage Analysis* 2026

- Diagnosed and resolved multiple real data-pipeline issues while building an analysis tool on public Indian power market data (POSOCO, IEX) – including a silent execution-order bug, a structural data anomaly from a regional administrative merger, and a 1000x unit-conversion error that would have misstated every financial output.
- Documented each issue with root cause, resolution, and reasoning in a day-by-day technical log, written so another person could follow the fix without re-deriving it – the same discipline required when escalating or handing off a support ticket.
- Validated data integrity by cross-checking pipeline outputs against known real-world reference values before trusting or reporting any figure.

Integration Debugging | *Lead Capture Automation (Make.com, Webhooks, Google Sheets)* 2026

- Built and debugged a form-to-spreadsheet automation workflow, resolving real integration issues including OAuth permission scopes, spreadsheet ID mapping errors, and nested JSON field extraction failures.
- Worked through webhook-based event triggers and conditional routing logic, gaining practical exposure to how backend integrations fail and how to isolate the cause.

Systems Modeling & Technical Communication | *Energy Grid Research, AROHAN 2025* Sept – Nov 2025

- Co-authored and presented research on decentralized energy storage systems at a national student research conference, translating complex technical and financial modeling into a clear presentation for a mixed technical/non-technical audience.
- Quantified and clearly communicated system-wide financial impact (Rs. 1.91 lakh crore/year baseline loss exposure) using scenario-based modeling.

ADDITIONAL TECHNICAL PROJECTS

Stability-Aware Dispatch Model & Indore Micro Universe Simulation | *Python, NumPy, Matplotlib* 2025 - 2026

- Built and tested simulation systems (industrial energy dispatch optimizer; 2,000-run Monte Carlo financial risk engine), iterating through failed configurations and documenting what broke and why at each step.
- utkxh.vercel.app/dispatch · utkxh.vercel.app/indore

Wearable Neck Posture Correction Device | *Arduino Nano, MPU6050* Jan – May 2025

- Developed and calibrated a wearable sensor device with real-time alert logic, debugging hardware-software integration issues through iterative testing.

EDUCATION

Shri G.S. Institute of Technology and Science (SGSITS), RGPV
Bachelor of Technology – Electrical Engineering

Indore, M.P.
2027
